

# Network

This API provides access to the network information.

The API allows developers to retrieve all the network class which are supported and the current setting values of the each network class as well as checking the availability of the network class and so on.

The network settings information includes the following:

- IP address
- DNS (Domain Name Server) address
- Gateway address
- Subnet mask address
- MAC address
- The DNS Server address configuration method (automatic / manual)
- The IP address configuration method (automatic / manual)
