

# Samsung Smart TV

Published 2014-10-27 |

Basic information about Samsung Smart TV.

Samsung Smart TV is a web-based application that runs on an application engine installed on digital TVs connected to the Internet. With Samsung Smart TV, users can extend their TV experience with web features.

Smart TV applications are special web pages implemented in a web browser and displayed on a TV screen. They provide content related to videos, sports, games, information, and much more. Users can download [Smart TV Applications](#) from [Samsung Apps](#) and install them on their TVs, or even develop their own applications.

Viewing an application on the TV screen is similar to viewing web pages in a web browser on a computer. The experience is not the same due to different screen resolution and hardware specifications, as well as using the TV remote control for user interaction.
