Nodename with # on 2012 platform

> Parsing nodes containing # character

Contents

[Source Files](#)

[Example](#)

During HTML Read, if nodeName is having "#" character like "#text" or "#comment" then it needs to be handled explicitly in case of webkit however in case of Maple, it is handled automatically.

For Webkit, '#' character needs to be taken care explicitly with the method given below.

>
> Refer to files in **this package**.

Example

```
if(xml.childNodes[i].nodeName.charAt(0) != '#') {
    // handle the node started with # here    }
else {
    // ?
}
```
